

# Managing the coal transition for workers in South Africa

## Scenario analysis of age cohorts & skills profiles of coal workers

Presented by Jules Schers (Expertise France / UCT)

with Vincent Bagilet (Columbia University) & Jesse Burton (UCT)

FORMAS

# Preliminary results of a study that...

- ▶ Asks whether affordable solutions for coal miners exist, were market forces *or* climate policy to reduce coal demand;
- ▶ Explores whether forced job losses can be avoided, assuming a *thought experiment: a hiring stop from 2020 onwards*;
- ▶ Considers the socio-economic characteristics of coal miners;
- ▶ And identifies possible solutions and makes a first estimate of their costs.

# Let's start with some numbers

| <i>x 1000<br/>workers)</i> | <b>Minerals<br/>Council*</b> | <b>QLFS**</b> | <b>Difference</b> |
|----------------------------|------------------------------|---------------|-------------------|
| <b>2012</b>                | 83.2                         | 77.5          | -5.7              |
| <b>2013</b>                | 88.0                         | 85.4          | -2.6              |
| <b>2014</b>                | 86.1                         | 84.1          | -2.0              |
| <b>2015</b>                | 77.7                         | 74.9          | -2.9              |
| <b>2016</b>                | 77.2                         | 63.7          | -13.5             |
| <b>2017</b>                | 82.2                         | 68.2          | -14.1             |

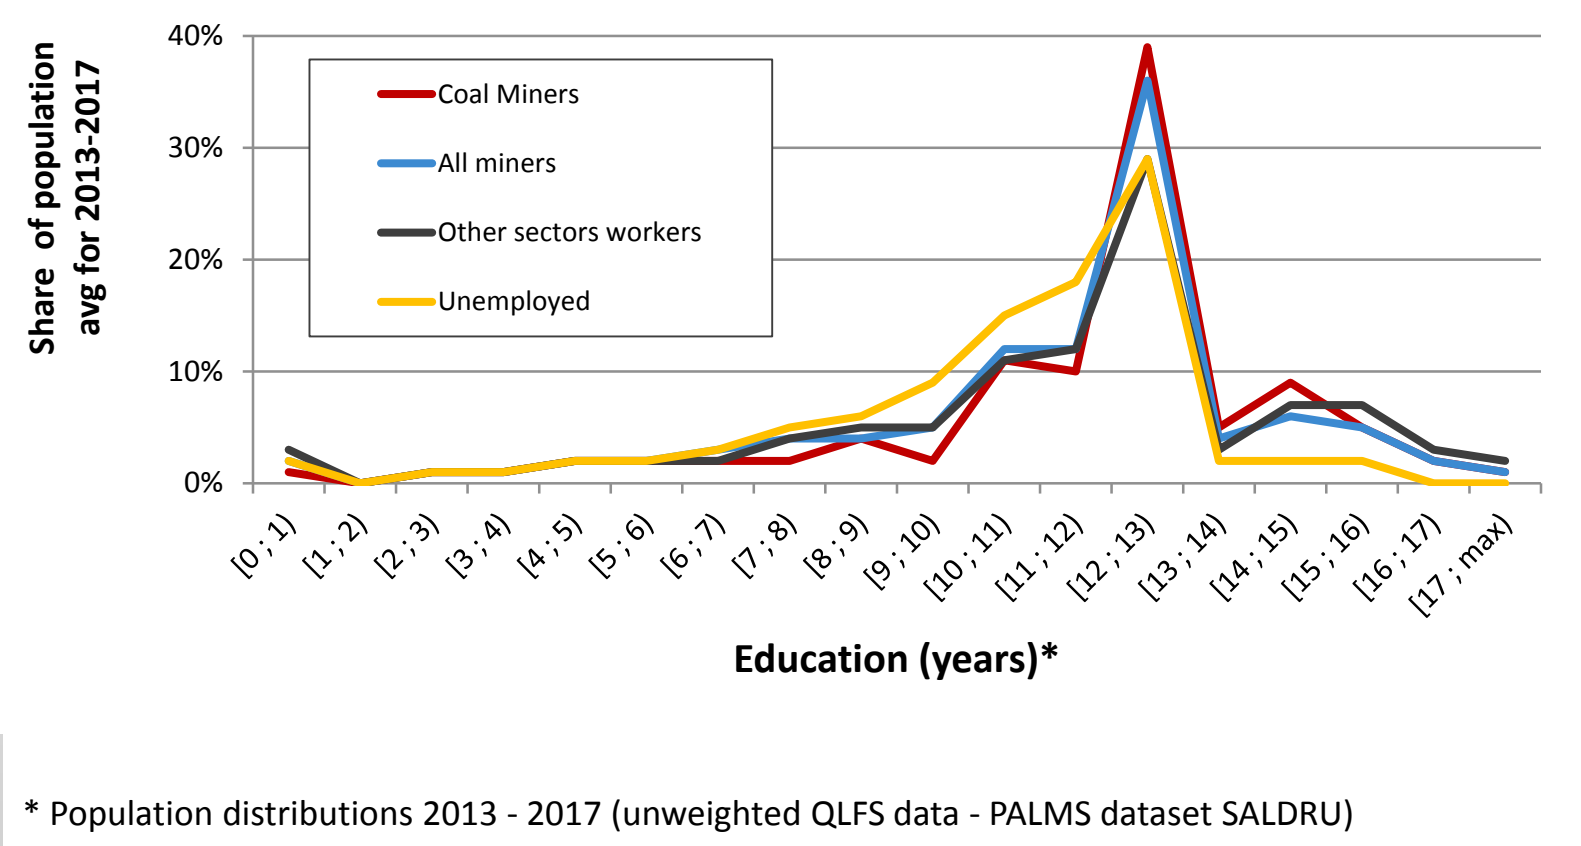

*Notes: \* Facts & Figures 2017 ; \*\* QLFS = annual average Quarterly Labour Force Survey of StatsSA; for 2016 and 2017 only 2 out of 4 surveys.*

- ▶ Coal Miners are too small as a sample to be measured in detail through national surveys...
- ▶ Mining company labour data is mostly not publicly available.

# What do we think we know: Coal miners are similar to other workers in age

# What do we think we know: Coal miners are similar to other workers in education

# What do we think we know: Coal miners earn more than other workers

\* Population distributions 2013 - 2015 for income data (unweighted QLFS data - PALMS dataset SALDRU); Quality of income data is mediorate due to under- or imprecise reporting of higher incomes.

# Coal miners seem to drop out of coal mining work force before retirement age

□ <NA> ■ 17 ■ 16 ■ 15 ■ 14 ■ 13 ■ 12 ■ 11 ■ 10 ■ 9 ■ 8 ■ 7 ■ 6 ■ 5 ■ 4 ■ 3 ■ 2 ■ 1

# Climate policy accelerates, but not change employment trend in coal relative to market forces

- ▶ Scenarios:
  - Reference  
= least-cost energy future
  - “Paris adjusted”  
= cost-optimal to well below 2°C

- ▶ Assuming constant intensity of employment over coal output
- ▶ 47k to 58k less jobs in 25 years → but how much unemployment?

Notes: \* Minerals council data used, because it reports higher employment numbers than Labour Force/Dynamics surveys;  
\*\* Coal mining output data comes from McCall et al. (2018)

# Retirement reduces forced job losses, but 2020'ies are a critical period

| Year                      | <i>Reference scenario</i>   |                           | <i>, of which:</i> |                      |
|---------------------------|-----------------------------|---------------------------|--------------------|----------------------|
|                           | Employment<br>(X 1000 jobs) | Reduction<br>past 5 years | People<br>retiring | Forced job<br>losses |
| 2020                      | 79.0                        | -                         | -                  | -                    |
| 2025                      | 65.2                        | 13.8                      | 3.0                | 10.8                 |
| 2030                      | 58.7                        | 6.5                       | 5.1                | 1.4                  |
| 2035                      | 48.4                        | 10.3                      | 6.2                | 4.1                  |
| 2040                      | 42.8                        | 5.6                       | 7.4                | -1.8                 |
| 2045                      | 31.8                        | 10.9                      | 11.3               | -0.3                 |
| <b>Totals 2020-2045 :</b> |                             | <b>47.2</b>               | <b>33.0</b>        | <b>14.1</b>          |

- ▶ Assuming retirement at 63, and age structure of recent years
- ▶ Forced job losses would be 14k in Reference (market forces)

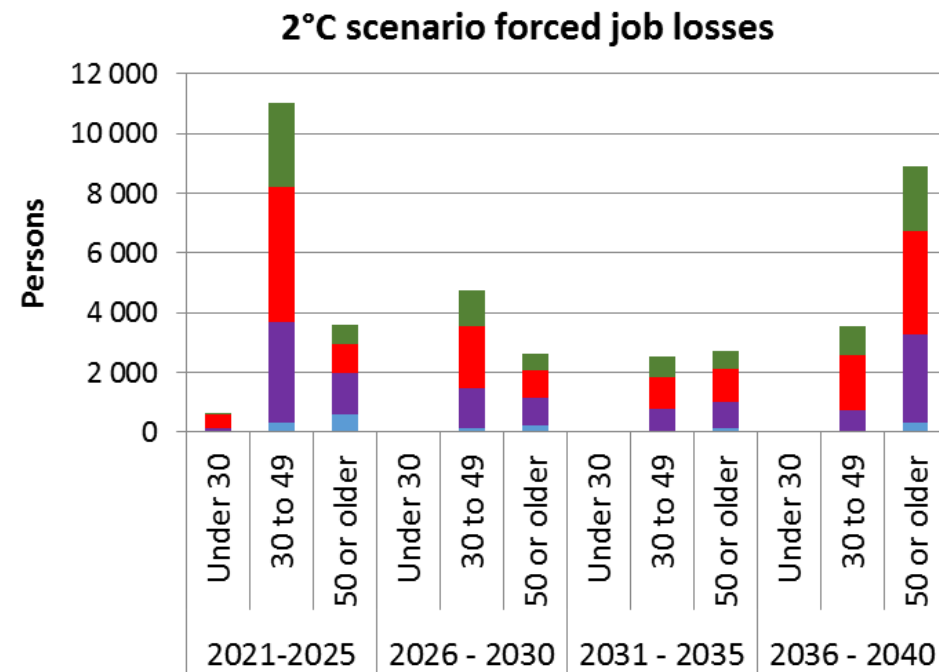

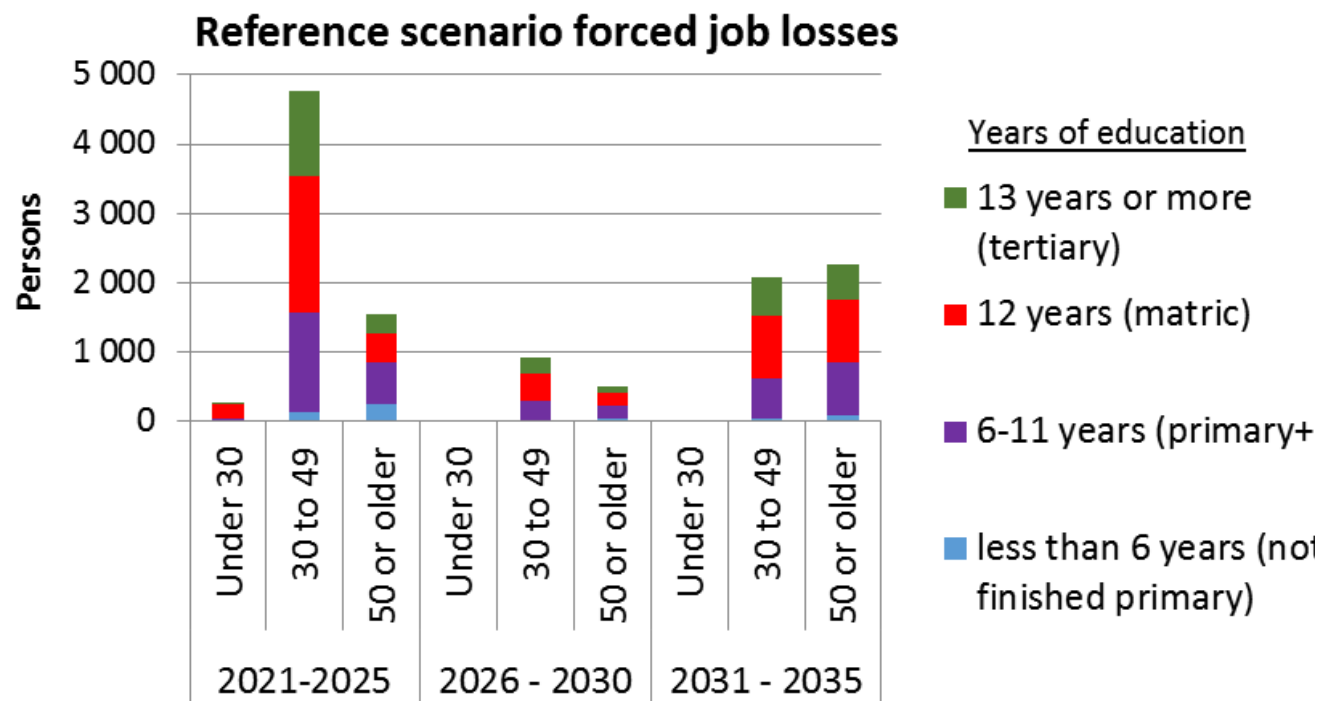

# Retirement reduces forced job losses, but 2020'ies are a critical period

| Year                      | <i>Paris adjusted</i>       |                           | <i>, of which:</i> |                      |
|---------------------------|-----------------------------|---------------------------|--------------------|----------------------|
|                           | Employment<br>(X 1000 jobs) | Reduction<br>past 5 years | People<br>retiring | Forced job<br>losses |
| 2020                      | 79.0                        | -                         | -                  | -                    |
| 2025                      | 57.0                        | 22.0                      | 3.0                | 19.0                 |
| 2030                      | 45.7                        | 11.4                      | 4.5                | 6.9                  |
| 2035                      | 35.9                        | 9.7                       | 4.8                | 4.9                  |
| 2040                      | 18.8                        | 17.1                      | 5.5                | 11.6                 |
| 2045                      | 20.7                        | -1.9                      | 4.9                | -6.8                 |
| <b>Totals 2020-2045 :</b> | -                           | <b>58.3</b>               | <b>22.7</b>        | <b>35.6</b>          |

- ▶ Assuming retirement at age 63 & age structure of recent years
- ▶ Forced job losses would be 36k jobs in Paris adjusted

# If job losers were to be a cross-section of coal mining labour force, *then they ...*

- ▶ Respectively 2,0k and 5,6k persons would be 30 to 49 yrs *with* a education above matric...
- ▶ *But* maybe more if last-in = first-out, or less if older workers loose jobs first

# Advancing retirement age to 58 years old could avoid almost all job losses in Reference

| (x 1000 persons) | <i>Reference</i>          | <i>People leaving the labour force if they retired ...</i> |                          |                      |
|------------------|---------------------------|--|--------------------------|----------------------|
|                  | Reduction in past 5 years | <i>... at 63</i>   | <i>between 58 and 63</i> | Remaining job losses |
| By year ...      |                           |  |                          |                      |
| 2020             | -                         | -  | -                        |                      |
| 2025             | <b>13.8</b>               | 3.0  | 6.0                      | <b>4.8</b>           |
| 2030             | <b>6.5</b>                | -  | 7.4                      | <b>-0.9</b>          |
| 2035             | <b>10.3</b>               | -  | 9.6                      | <b>0.7</b>           |
| 2040             | <b>5.6</b>                | -  | 13.8                     | <b>-8.2</b>          |
| 2045             | <b>10.9</b>               | -  | 15.1                     | <b>-4.2</b>          |
| <b>Totals</b>    | <b>47.2</b>               | <b>3.0</b>   | <b>51.9</b>              | <b>-7.8</b>          |

- ▶ Retirement at 58 seems already common practice in coal mining

# Advancing retirement age to 53 years old could avoid most job losses in “Paris adjusted”

| (x 1000 persons) | <i>Paris-adjusted</i> | <i>People leaving the labour force if they retired ...</i> |                  |                          | Remaining job losses |
|------------------|-----------------------|--|------------------|--------------------------|----------------------|
|                  |                       | <i>in past 5 years</i>                                     | <i>... at 63</i> | <i>between 58 and 63</i> |                      |
| By year ...      |                       |  |                  |                          |                      |
| 2020             | -                     | -  | -                | -                        | -                    |
| 2025             | <b>22.0</b>           | 3.0  | 6.0              | 7.4                      | <b>5.6</b>           |
| 2030             | <b>11.4</b>           | -  | -                | 9.6                      | <b>1.8</b>           |
| 2035             | <b>9.7</b>            | -  | -                | 13.8                     | <b>-4.1</b>          |
| 2040             | <b>17.1</b>           | -  | -                | 15.1                     | <b>2.0</b>           |
| 2045             | <b>-1.9</b>           | -  | -                | 13.8                     | <b>-15.7</b>         |
| Totals           | 58.3                  | 3.0  | 6.0              | 59.7                     | -10.4                |

# Earlier retirement age is not unaffordable...

- ▶ *Estimated* cost of retiring 44k workers 5 years in Reference: R3.0 bn/year (2020 to 2040):
  - ▶ Assuming 100% of an average annual salary in coal of 272 kR\*;
  - ▶ Total costs would equate R(2017) 60 bn;
  - ▶ Counting 23 bn saved on Coal IPP subsidy\*\*, R37 bn remains = R 1.9 bn/year;
  - ▶ This equals estimated “weak carbon tax” revenue (R1.8 bn/yr for 2019/2020)\*\*\*;
  - ▶ Preliminary estimate of retirement at 53 in “Paris-adjusted”: 2,5-3 times higher;
- ▶ This is a high-end estimate:
  - ▶ Retirement seems already to happen before age of 63 years;
  - ▶ People will partly be re-employed else;
  - ▶ How much over relative to cost (LCOE) of electricity ?

# *However, things are more complicated...*

- ▶ Real age structure & salaries workers loosing jobs ?
- ▶ Whom *or* which fund should pay ?
- ▶ Other factors also put coal output & employment at risk ;
- ▶ Other issues :
  - ▶ Solution for youth in coal mining regions: training to work in other sectors?
  - ▶ Do we need a bail-out of mortgages for home owners in mining towns?
- ▶ Other (cheaper?) solutions:
  - ▶ What is the need & cost of re-training of younger miners for a job in other (mining) sectors?
  - ▶ Voluntary leave premia?
  - ▶ Coal mining regions *can* develop new economic activity ...

# Conclusions for a Just transition

- ▶ Solutions for disappearing coal mining employment are possible → See experience in other countries;
- ▶ Solutions are required as of this year !
- ▶ Costs depend on the approach and coal miner characteristics;
- ▶ Economic re-development of mining regions is very important!
- ▶ This requires **in-advance planning** and more research, thus **good & detailed data !**

# Thank you!

*Your feedback is very welcome !*
